# Internet of Things for the Extended Enterprise

GIOVANNI.MIRAGLIOTTA@POLIMI.IT

# Who am I?

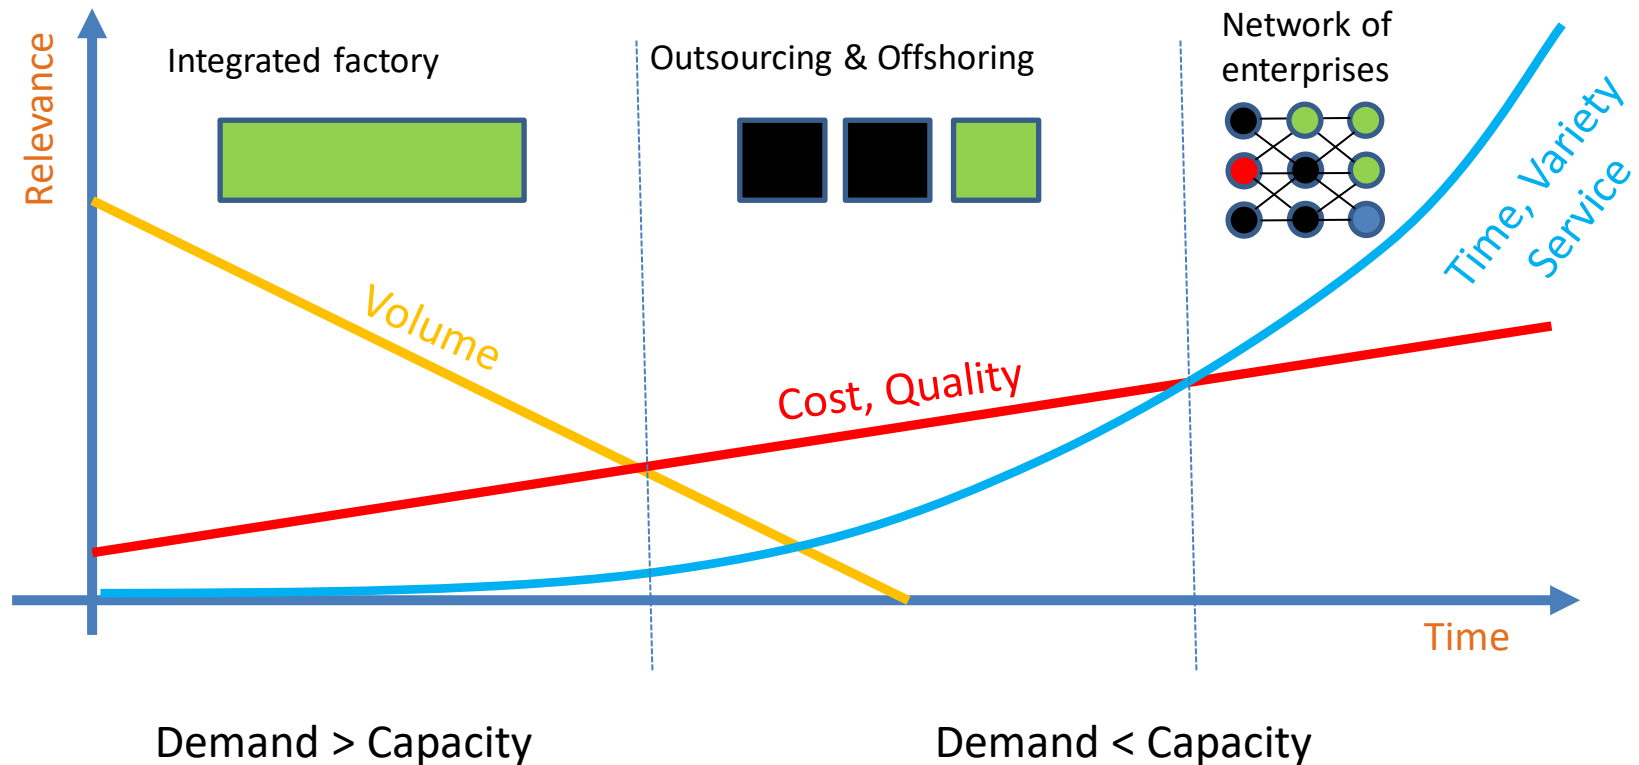

- Professor of Advanced Supply Chain Planning @ Politecnico di Milano
- Senior director at Osservatori.net, 100-people research group on Digital Innovation:
  - Internet of Things / Industry 4.0
  - Artificial Intelligence
  - 5G
  - Smart and Connected Mobility
- Co-founder of the Internet of Things Lab, the applied research lab of Politecnico di Milano on IoT ([www.iotlab.polimi.it](http://www.iotlab.polimi.it))
- Co-founder of the AIRIC, the applied research center of Politecnico di Milano on AI ([www.airic.polimi.it](http://www.airic.polimi.it))
- Co-founder of IqConsulting, academic spin-off, now part of Digital360 (listed)
- More than 100 cooperation projects with leading Italian and International companies
- To contact me:
  - [linkedin.com/in/giovanni-miragliotta-4617a0](https://www.linkedin.com/in/giovanni-miragliotta-4617a0)

- Benefits Evaluation
- Q&A

# A brief history of competition

# Supply Chain Management

## Definition

- The firm is not a stand alone entity but it is part of a network of interconnected firms: optimizing internal processes is no longer enough
- Need to manage processes beyond the boundaries of the single company, because there has been a shift on competition: from **“Company vs Company”** to **“Value Chain vs. Value Chain”**

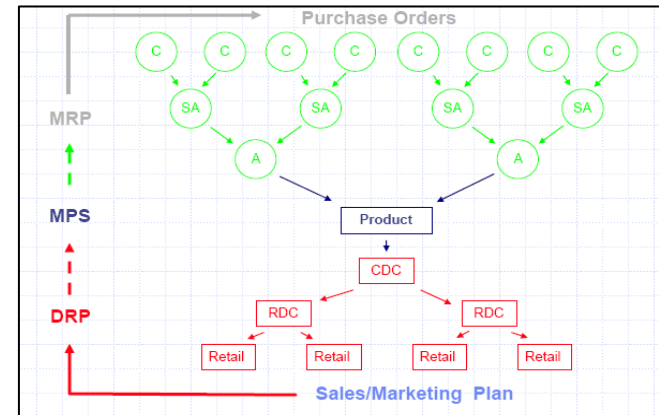

**Network, Processes, Information and Money  
managed as a whole, in a dynamic environment**

# A brief history of competition

Business needs and tech requirement

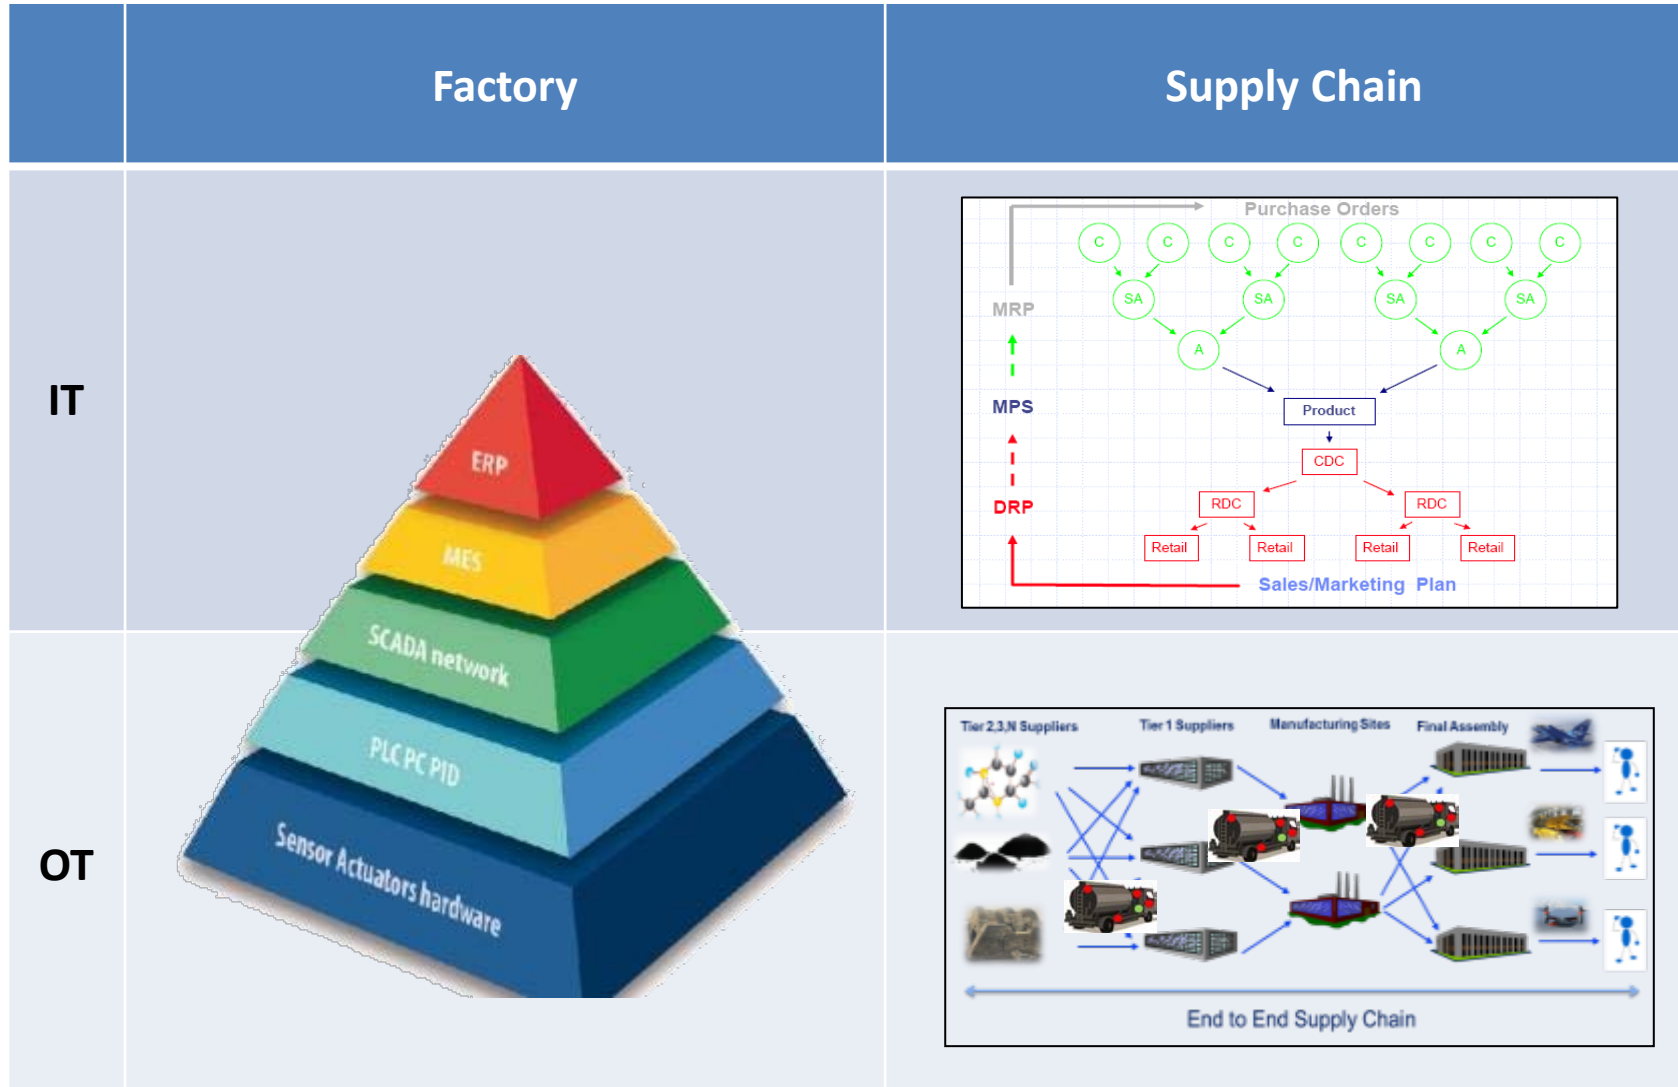

Evolving business needs	Tech Requirements
Globalization, decentralization, fragmentation	Visibility, business integration, ubiquity, dependability, scalability
Competing on time	Sub-optimal, fast decision making, simulate to promise reliable dates
Competing on variety, with shorter lifecycles	Complex decision support (multiple products, sites, etc.) scenario and uncertainty management
Competing on services	Connected products, knowledge from data

# The gap between Information and Operations

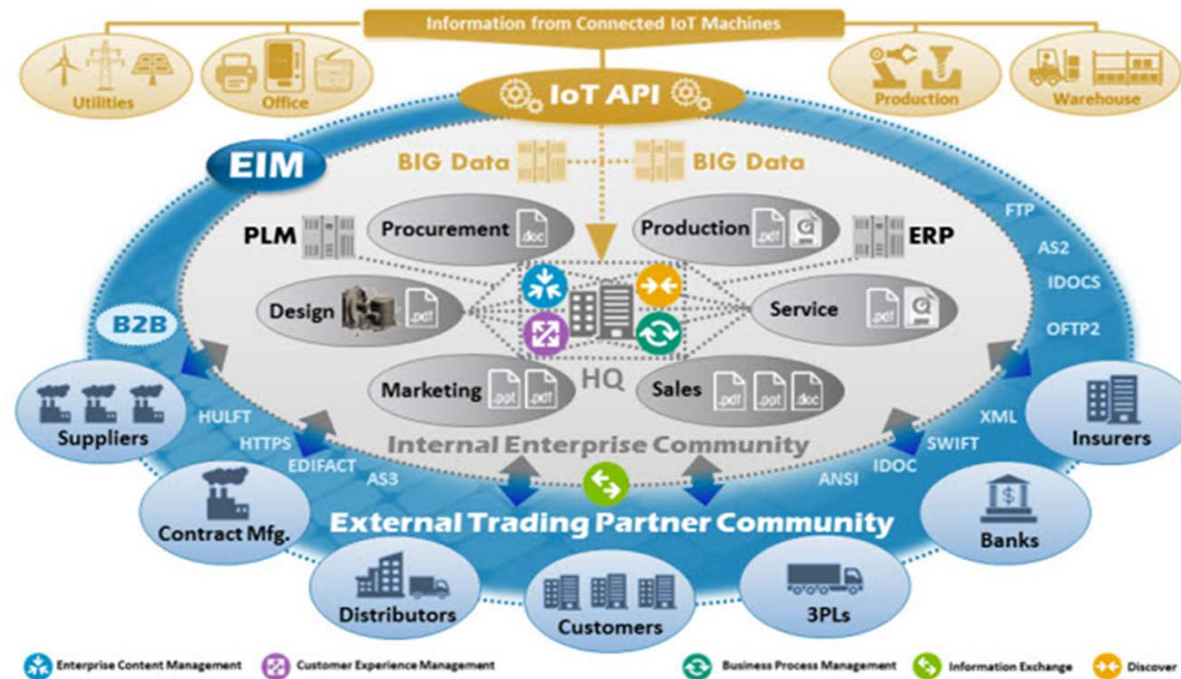

# The gap between Information and Operations

# The Extended Enterprise

*"The extended enterprise is the entire set of **collaborating companies**, both upstream and downstream, from raw material to end-use consumption, that **work together** to bring value to the marketplace"*

E.W. Davis, R.E. Spekman, 2004, "Extended Enterprise: gaining competitive advantage through collaborative Supply Chain", Prentice Hall

# The Extended Enterprise... what?

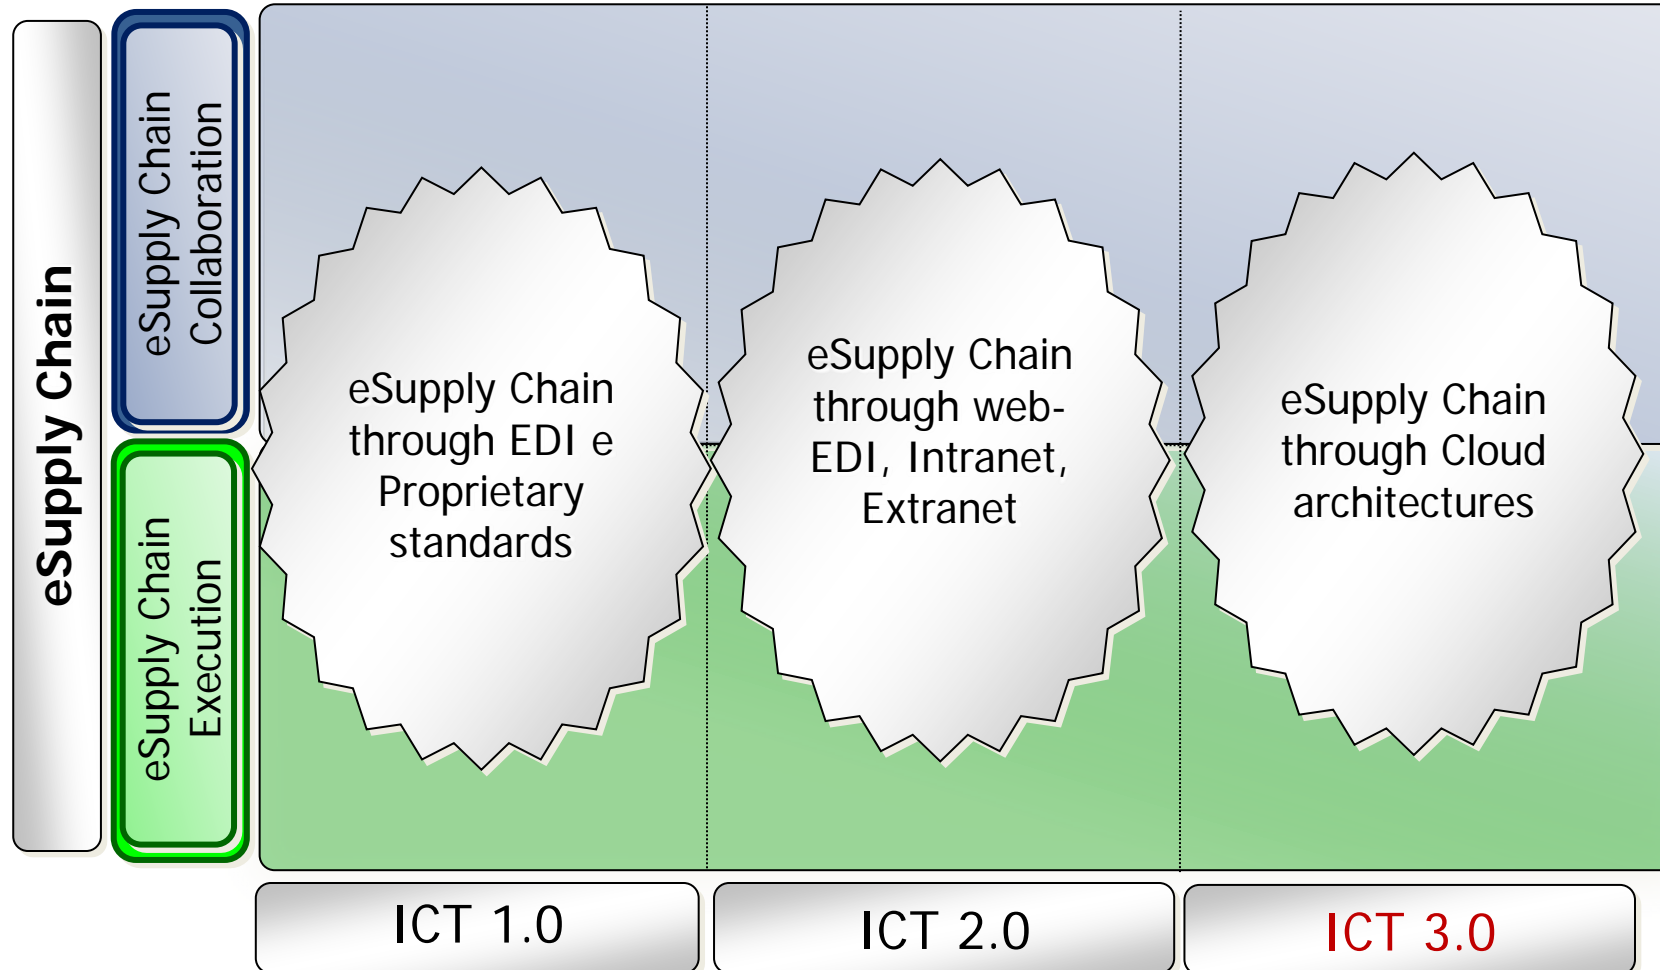

*The following slides contain explicit material which should only be viewed by **consenting adults***

# What is at stake?

- “In January 1999, a car demolition company in Walloon, Belgium, delivered oil from a transformer to a municipal oil recycling plant. That oil contained approximately 1 gram of dioxins.
- The oil ended up in a vegetable oil storage tank, an ingredient for feedstuff. Through the animal feed, the contaminated product entered the human food chain.
- The problem could not be contained since a targeted recall was impossible:
  - there were few records on the feedstuff ingredients, the production date or the batch identity;
  - it was impossible to ascertain whether other feed factories were involved
  - it was impossible to ascertain which farmers had bought the contaminated feedstuff, let alone which food products were contaminated and to which countries these products had been transported.
- Consequently, it was impossible to launch a proper recall, due to a lack of coherent and adequate information. As a result, millions of Euros were wasted on the withdrawal and recall of products that on hindsight were perfectly safe, but that were considered to be a major public health risk at the time.
- Ever since, the concept of the implementation of traceability in the food supply chain has received a great deal of attention. [CIES, 2005]”

  - Who is supposed to record?
  - How is information shared?

# The solution requirements

- We need a new technology to bridge the gap between digital and physical worlds:
  - Give a unique identity to every single object
  - Automatically acquire this identity
  - Effectively bring the data acquired to the digital world
  - Make physical objects talk and work with each others
- ... in line with openness and interoperability principles

# Radio Frequency Identification

## Definition

RFid (Radio Frequency Identification) is a technology for the automatic identification of objects, animals or people, the measurement and the communication of the collected data in radiofrequency by using smart tags (autonomous power supply, embedded software)

# Radio Frequency Identification

## History

- RFI applications have more than 50 years...

# Radio Frequency Identification

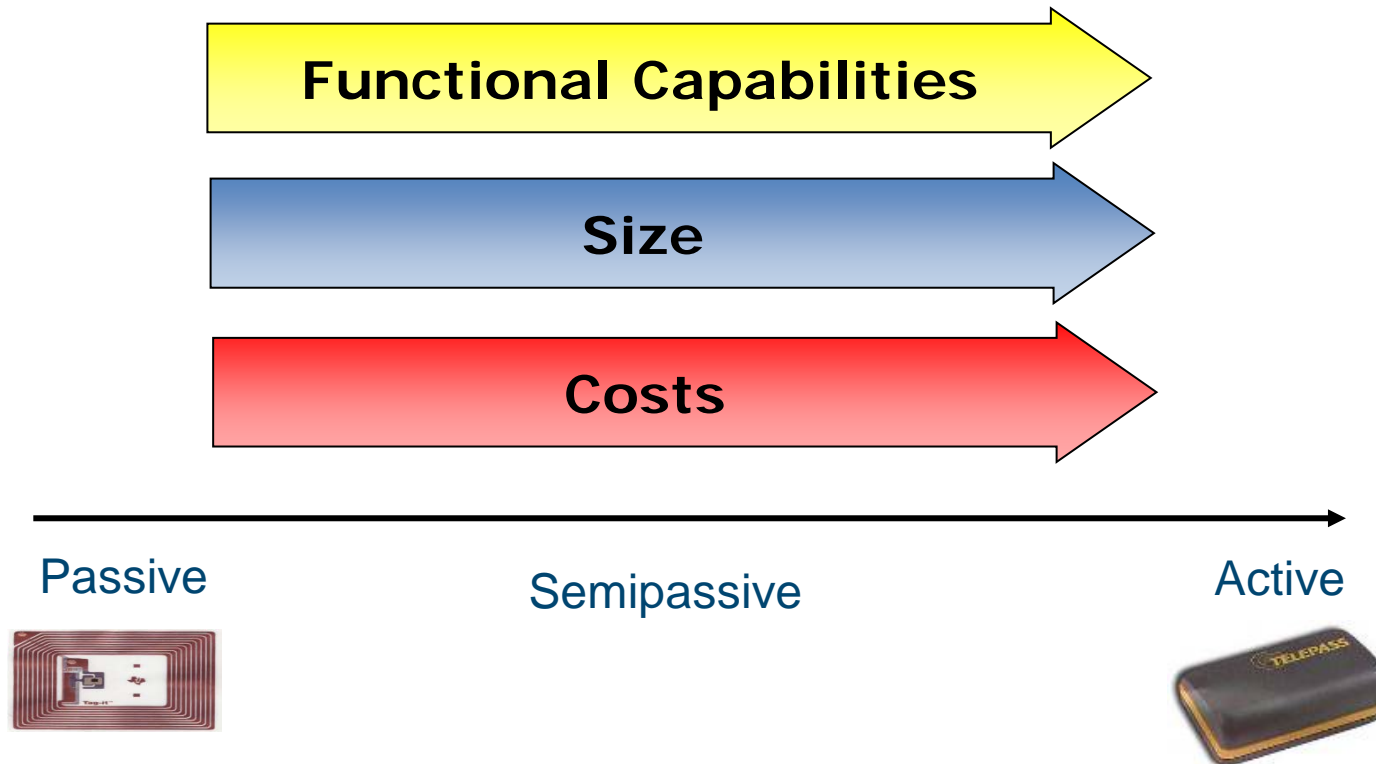

What's new?

- Passive technologies
- New materials and processes
- New frequencies
- Computation and networking capabilities

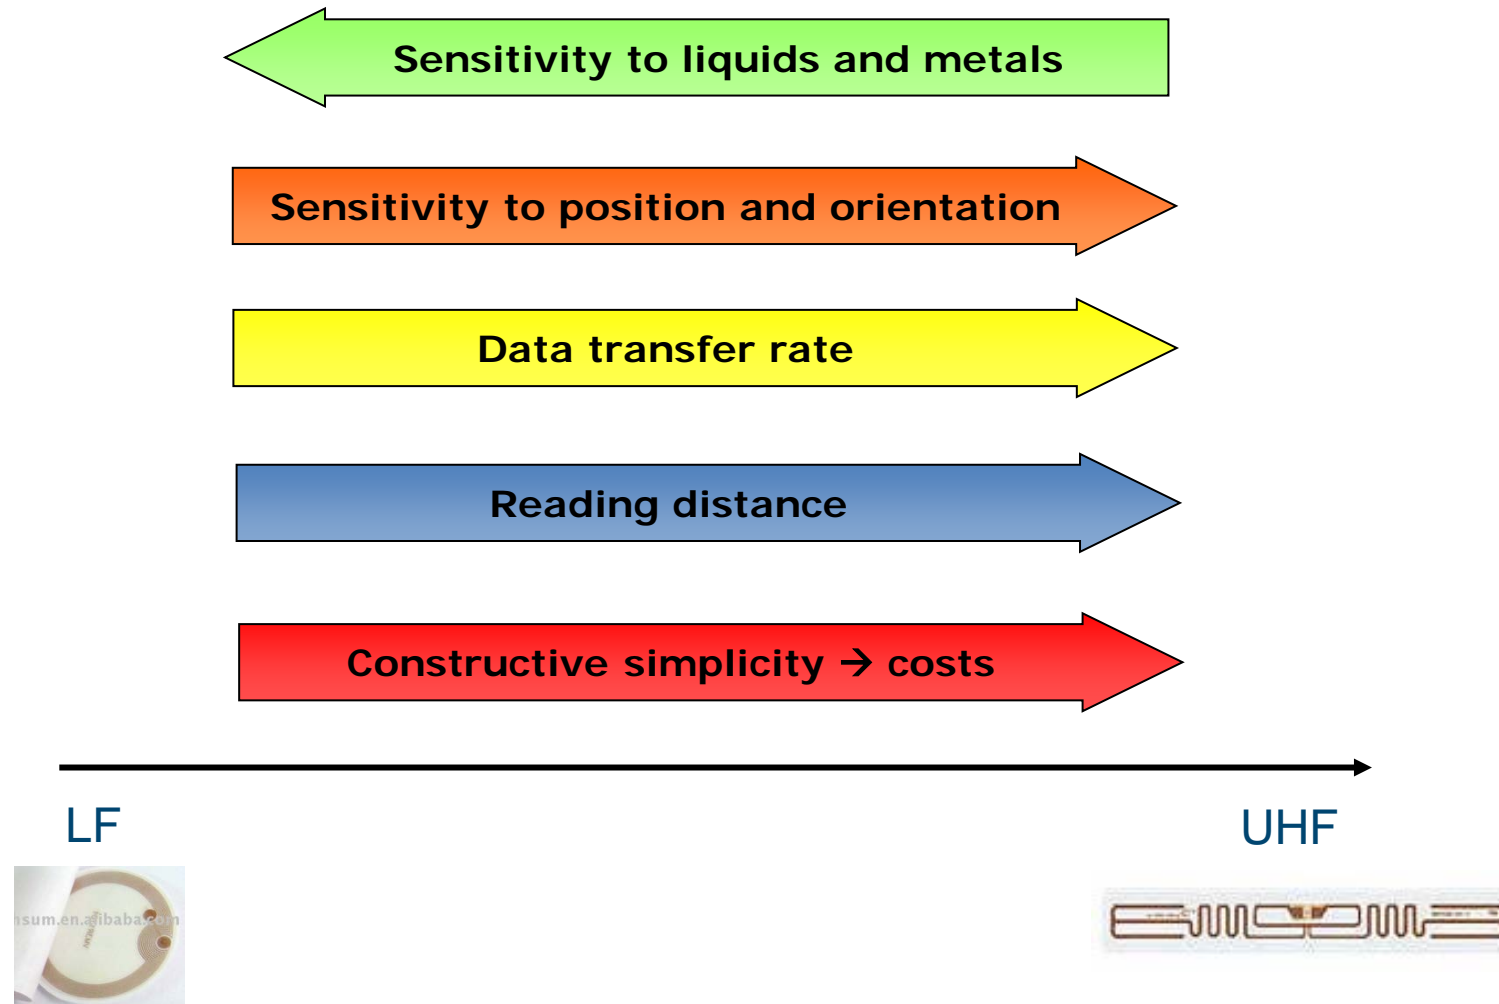

# Radio Frequency Identification

A comparison with barcode...

# Radio Frequency Identification

Operating frequencies

# Radio Frequency Identification

Near Field Communication (NFC)

## Near Field Communication

**Nokia**  
6131 NFC

# Radio Frequency Identification

## Advanced applications

### Passive RTLS

- Passive tags (standard ones) with dedicated readers infrastructure:
  - 3-5 mt height
  - 1 reader can cover up to 130 sqm
  - Simple installation, Power-over-ethernet
- Precision:  $\approx 1.5$  mt:
  - Wide Area Monitoring (tag inventory);
  - Tag movement (through sectors)

The xArray gateway provides exceptional location assignment and wide-area monitoring with its 52-beam phased array antenna.

### Special Tags

#### Double frequency

Sewn-in antenna

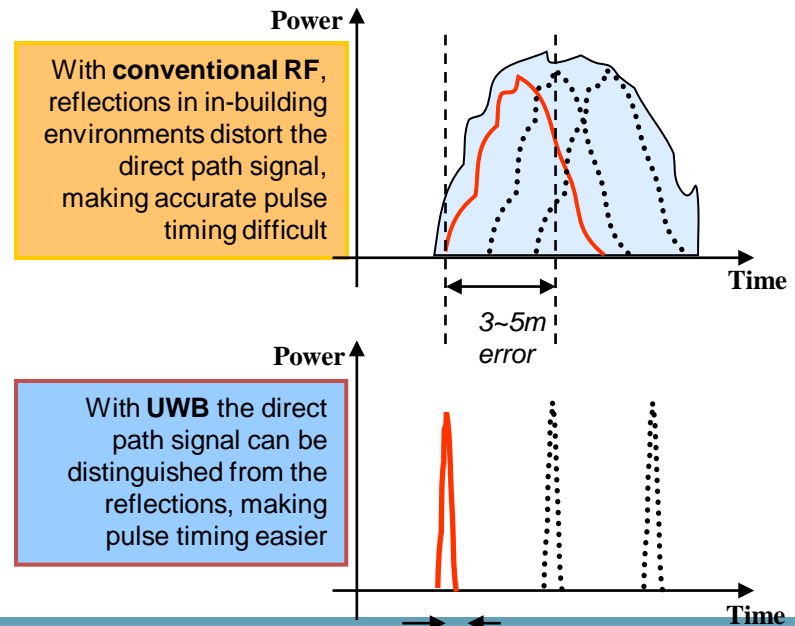

# Radio Frequency Identification

Advanced applications

## Wireless Sensor Networks

(Zigbee et similia)

# Radio Frequency Identification

A comparison with barcode...

- Automated reading
  - No line of sight
  - Multiple reading
  - Data transfer speed
  - Secured information
  - Large storage capacity
  - Read / Write
  - More robust
  - Smaller
  - Reusable
  - Sensors, etc...
- Cheap
  - Simple
  - Feasible expectations...

# Did it work?

The Walmart mandate (2003)

## Wal-Mart Expands RFID Mandate

The world's largest retailer says that it will ask *all* suppliers to tag pallets and cases by the end of 2006.

By Bob Violino

**Aug 17, 2003**—Aug. 18, 2003 - If anyone still has any doubts that Wal-Mart is serious about deploying [RFID](#) technology in its supply chain, they should be dispelled by its latest revelation. The world's largest retailer says it will require all suppliers to put [RFID](#) tags carrying Electronic Product Codes on pallets and cases by the end of 2006.

"We have asked our 100 top suppliers to have product on pallets employing [RFID](#) chips and in cases with [RFID](#) chips," says Wal-Mart spokesman Tom Williams. "By 2006, we will roll it out with all suppliers."

# Did it work?

## The Walmart mandate (2007-2009)

**October 2007:** Wal-Mart announces a major change in its RFID strategy, largely abandoning the initial pallet/case focus on shipments going to Wal-Mart stores in favor of three focus areas: (1) shipments going to Sam's Club; (2) promotional displays and products going to Wal-Mart stores; (3) tests to see RFID's impact in improving category management in select areas. "We're coming at RFID from a different angle," Wal-Mart's VP of Information Technology, **Carolyn Walton**, says at the EPC Global conference.

**January 2008:** Wal-Mart announces its first real compliances "penalties" for failure to tag products, specifically for shipments to its Sam's Club chain. Wal-Mart says in letter to suppliers that a failure to tag pallets sent to its distribution center in DeSoto, Texas, or directly to one of its stores served by that DC after January 31 will be charged a service fee, starting at \$2 per untagged pallet on Feb. 1, and capping at \$3 per pallet on Jan. 1, 2009.

Wal-Mart also announced its plans for the Sam's Club rollout (later changed):

- Jan 30, 2008: pallet-level tagging for DeSoto, Tex., distribution center.
- Oct. 31, 2008: pallet-level tagging for an additional four distribution centers, case- and mixed-pallet level tagging for Texas distribution center.
- Jan. 30, 2009: pallet-level tagging for remaining 17 distribution centers, case- and mixed-pallet level tagging for an additional four distribution centers.
- Oct. 31, 2009: case- and mixed-pallet level tagging for the remaining 17 distribution centers; selling-unit -level tagging for Texas distribution center.
- Jan. 30, 2010: selling-unit-tagging for an additional four distribution centers.
- Oct. 31, 2010: selling-unit-tagging for remaining 17 distribution centers

**January 2009:** Sam's Club dramatically lowers penalties for failure to tag pallets from \$2-3 dollars per pallet to just 12 cents - what Wal-Mart estimates it will cost Sam's to do the tagging itself. It also pushes back the rollout schedule announced the previous January, saying the tagging requirement will apply only to pallets sent to the DeSoto DC or stores served by that DC in 2009. DC. Pallet-level tagging is expected to be rolled out chain-wide in 2010, while the deadline for tagging sellable units is "under review."

**February 2009:** Procter & Gamble says that after "validating" the benefits of RFID in merchandising and promotional displays, it is ending its pilot program with Wal-Mart for those displays, implying Wal-Mart is not acting on the information to improve store execution.

EPCIS Standard

Electronic Product Code Information Services (EPCIS) defines standard interfaces to access information

- **Standard GS1**
- Natively integrated in common **ERP** and **track&trace** applications
- **Complementary to EDI**
- **Doen't need RFID**
- Works with GS1 barcodes
  - SGTIN
  - GTIN + batch number
- Approved **ISO/IEC 19987**

# Identify, Capture, Share

EPCIS Standard: the Core Business Vocabulary (CBV)

- Defines the semantic vocabulary of business interaction
- Standardizes semantics of information
- **Fundamental** for interoperability of EPCIS
  - Values and definition of **Standard Vocabularies**
  - Syntactic rules to define custom **User Vocabularies**
- Approved **ISO/IEC** 19988

# Identify, Capture, Share

Cloud platforms for SCM

# Align to industry (best) practices

## Cloud platforms for SCM

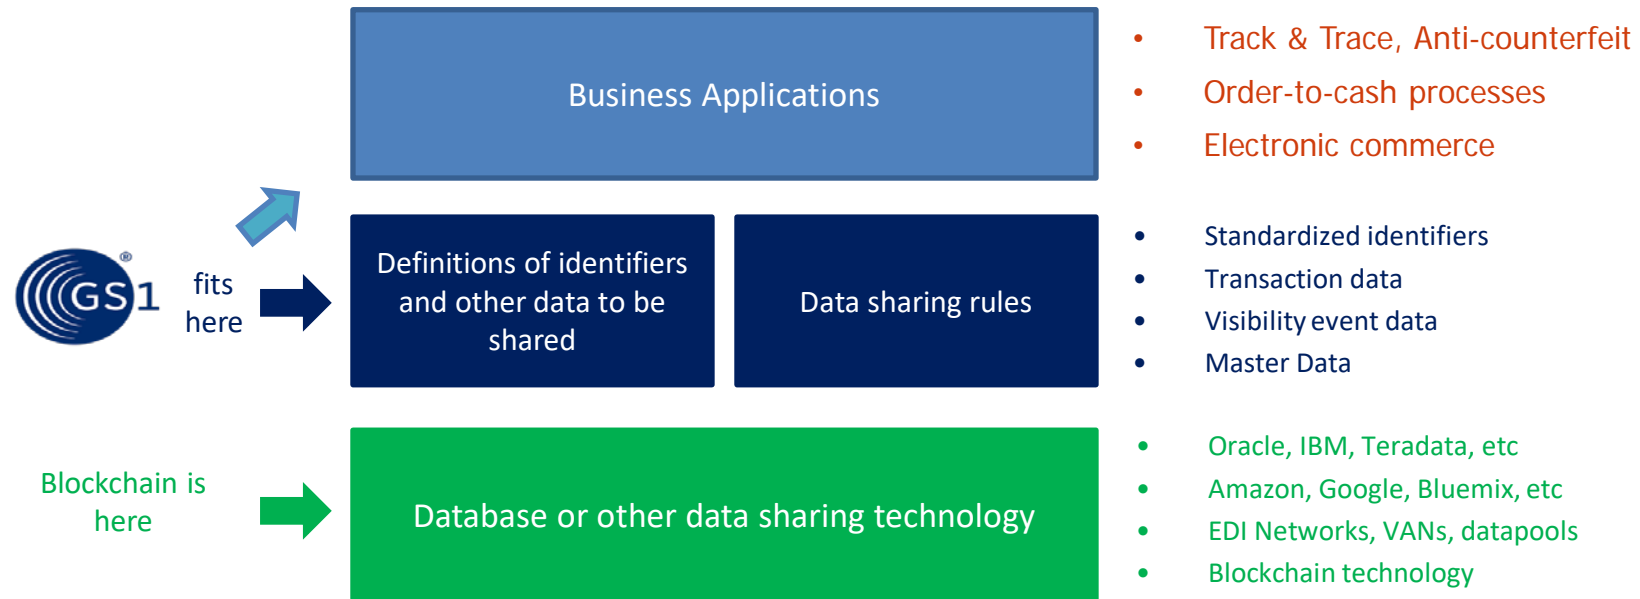

# Data architecture

Is there a fourth way?

# Does blockchain mean Traceability?

**Blockchain is a shared, secure, distributed ledger**  
**GS1 is about standards for data and business applications**

- To achieve traceability, parties must agree on data **content (e.g. CBV)**
- **EPCIS** makes a **distinction between data and the database: EPCIS is explicitly agnostic** as to what sort of database is used... **also a blockchain**
- EPCIS defines interfaces between **different systems** so they can **share data** even if they use **different underlying DB technologies**

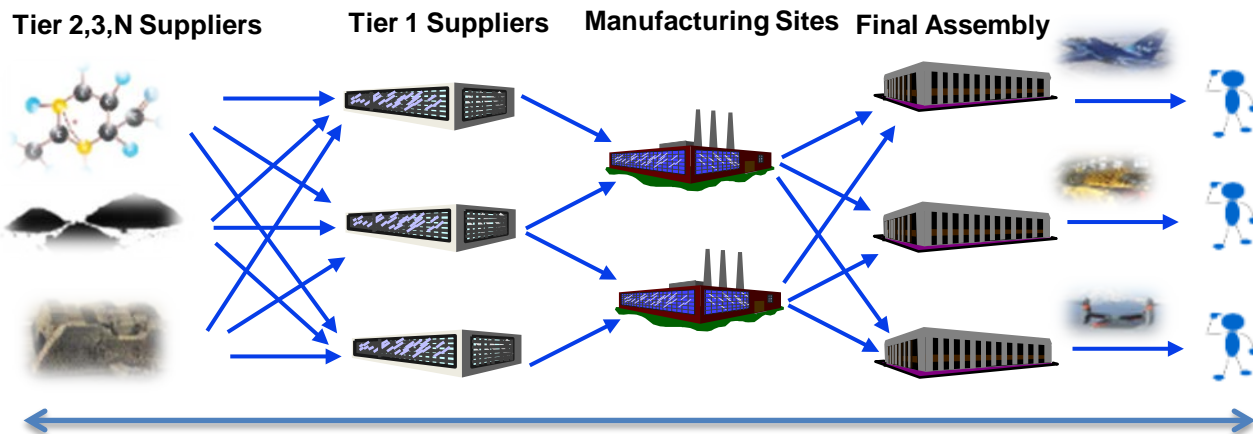

# Is IoT ready for blockchain?

Native IoT Blockchain device?  
No, a Third-party Oracle

**BLOCKCHAIN**

Certifies the digital data

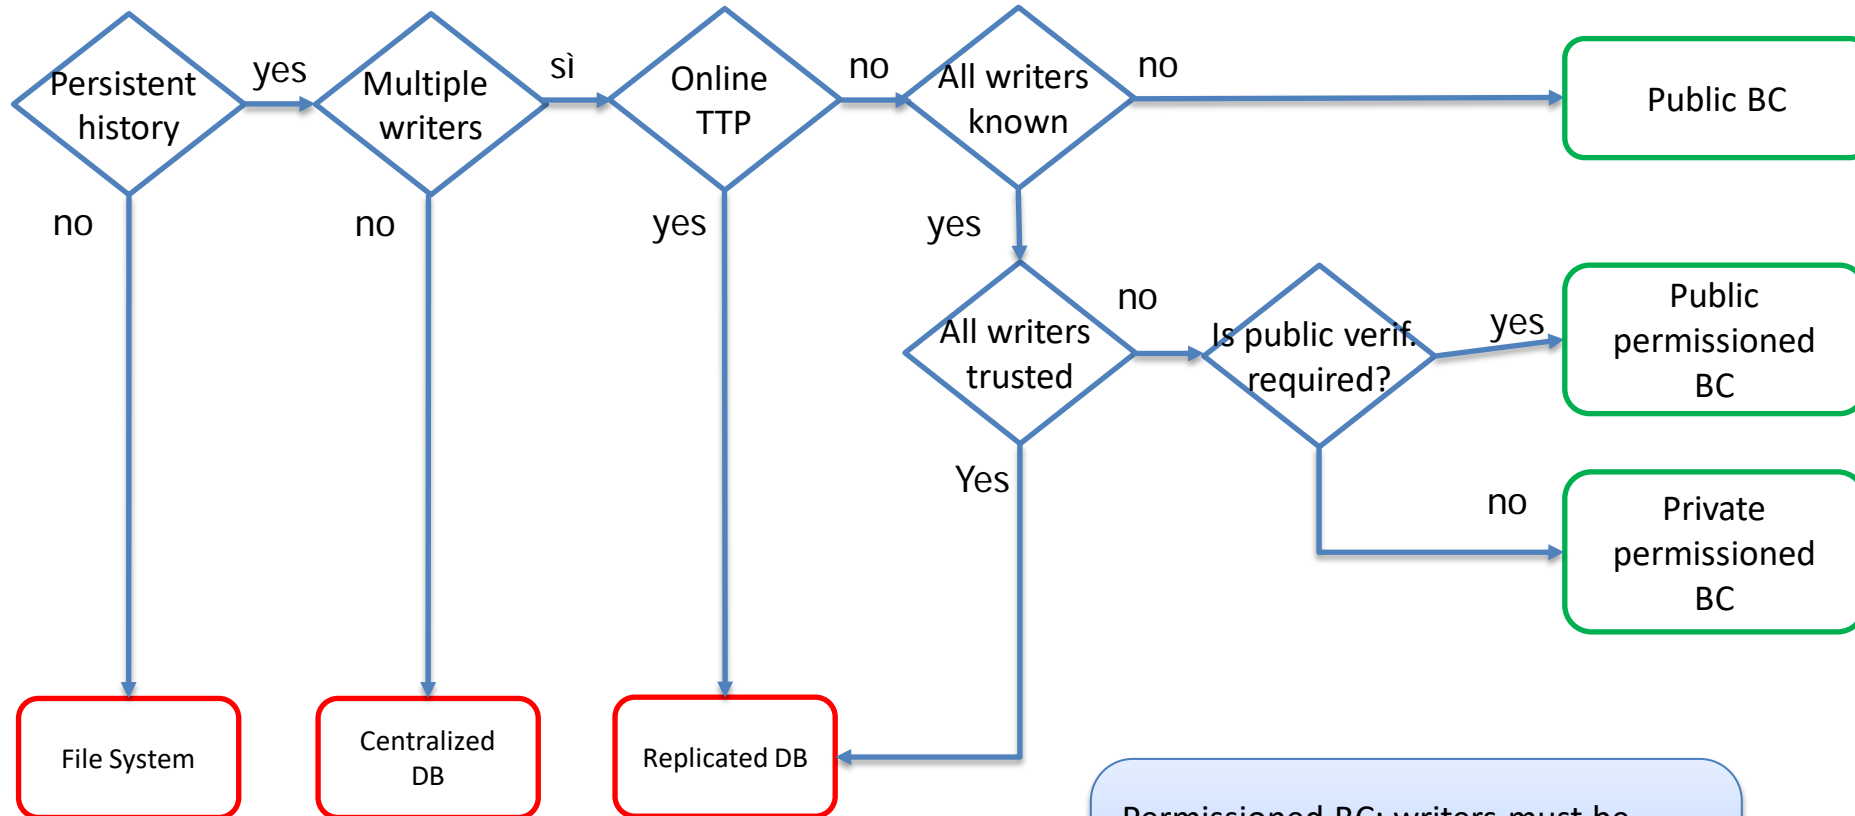

**IoT**

Acquires digital data about physical processes

# Do I need a BC?

Wüst & Gervais (ETH Zurich)

Permissioned BC: writers must be approved by participants  
Private BC: readers must be approved by participants

# Agenda

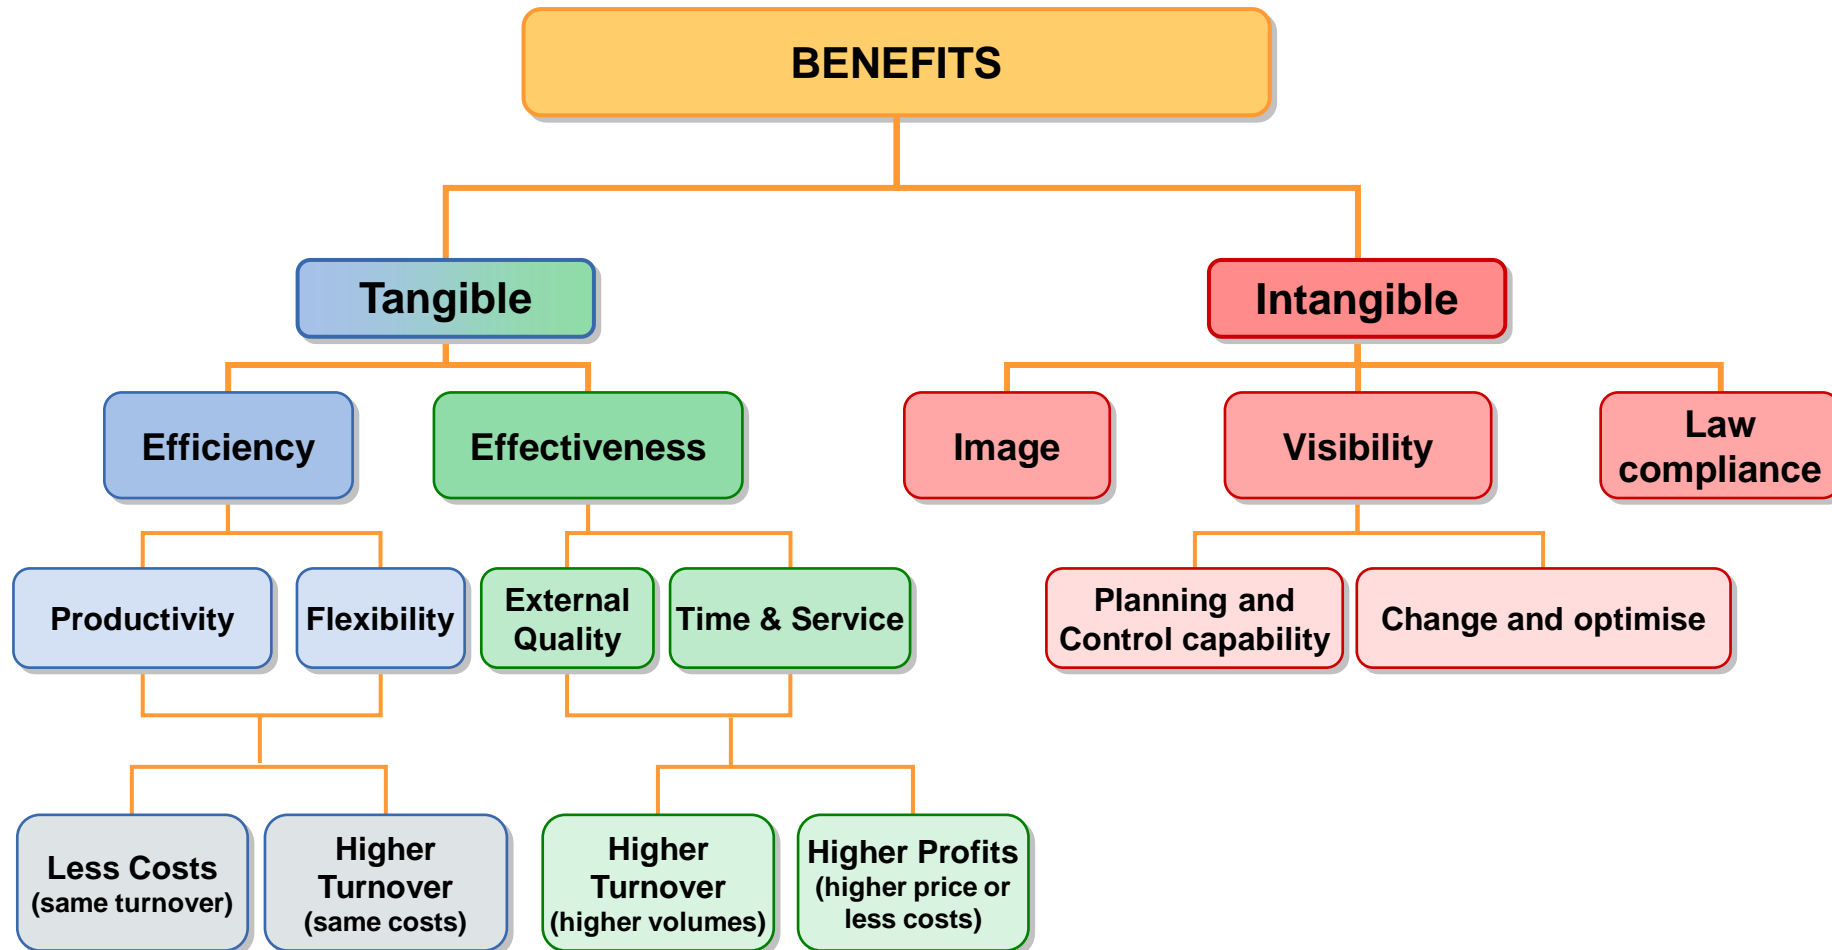

- Foreword
- Technologies for the Extended Enterprise
- Data Architecture
- Benefits Evaluation
- Q&A

# Adoption process of a new technology

- The adoption process of every new technology can be:
  - “Conditioned”:
    - ROI>0
    - Given PBT, etc.
  - “Convincing”:
    - Perceivable impact on a set of performances...
    - ...aligned with the Entrepreneur’s expectations
  - Emotional
    - *A posteriori* evaluation

# Evaluating the Extended Enterprise

A reference framework

# Efficiency benefits

## Generalizing the method

- ABM / ABC methodology:
  - Map process (to the correct level of details) in the As Is situation
  - For each activity, identify the needed resources, and their unit costs
    - People, space, energy, capital, ...
  - For each activity, identify resources' consumption drivers
    - # of Pieces, # of setups, ...
  - Measure the consumption of drivers, and therefore used resources
  - Assess the cost of the As Is process
  
  - Re-engineer the process, define the To Be situation
  - Re-draw the new process map and modified activities
  - Re-apply ABC
  - Estimate the cost of the To Be process

Importance of realistic assumptions (e.g. people and costs not completely avoidable)

# Efficiency benefits

## Generalizing the results

- RFID Gate scenario

	"As Is Uncooperative" base-line scenario	"Collaborative" base-line scenario
Base-line scenario COST (€/year)	244,000	188,000
"RFID Gate" COST (€/year)	174,400	173,400
"RFID Gate" BENEFITS (€/year)	69,600	14,600
"RFID Gate" %BENEFITS	28.7 %	7.5 %

RFID tags paid by	Base-line scenario	"RFID gate"	
		NPV (€)	Payback (years)
Wholesaler	As-Is	- 170,000	∞
Wholesaler	Collaborative	- 340,000	∞
Manufacturer	As-Is	250,000	0.2
Manufacturer	Collaborative	40,500	1.0

RFID tag prices enabling a positive NPV (tags paid by the wholesaler)

Base-line scenario	"RFID gate"
As-Is	0.12 €
Collaborative	0.04 €

# Efficiency benefits

## Open issues

- What if 100% reading accuracy cannot be achieved?

# Efficiency benefits

## Open issues

- What if 100% reading accuracy cannot be achieved?

- Only 91 % of cases could be accurately read

# Efficiency benefits

## Open issues

- What if 100% reading accuracy cannot be achieved?

- 91% of cases → 75% of pallets  
→ Proportional impact on measured benefits

# Efficiency benefits

## Open issues

- What if 100% reading accuracy cannot be achieved?

# Efficiency benefits

Generalizing the method

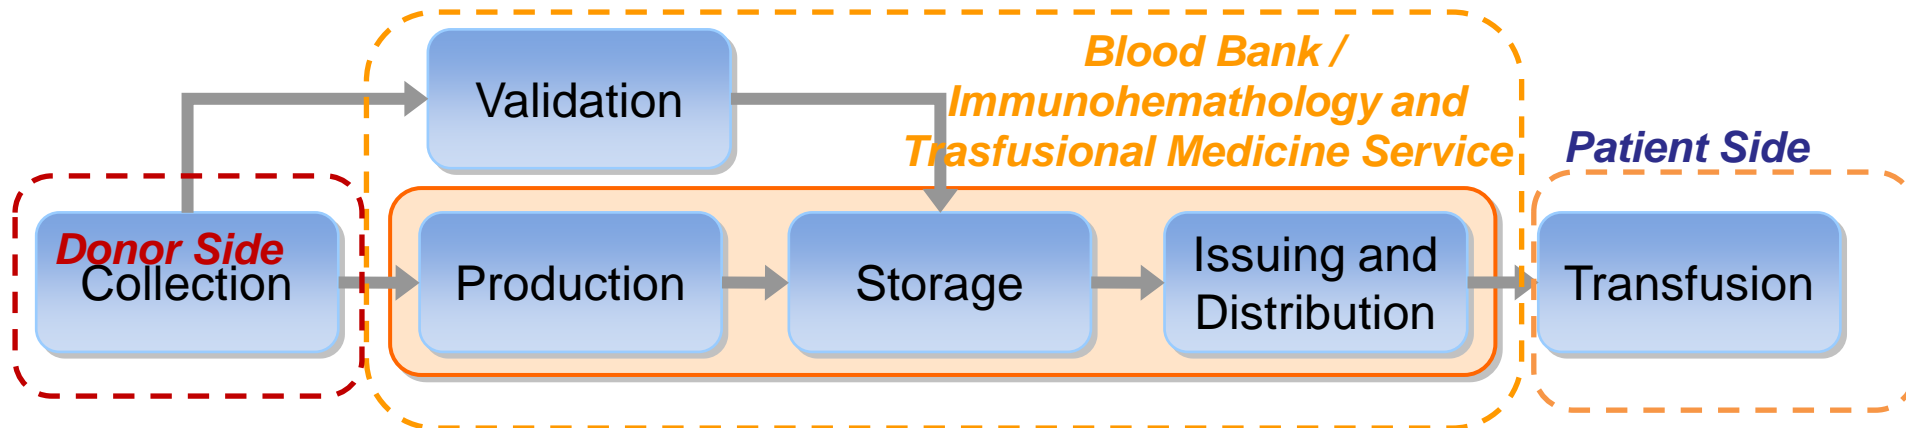

- Activity Based Modelling methodology
- Realistic assumptions, reliable cost accounting data
- Identification of relevant impacts depending on tech reliability

		Impact	
		Single company	Supply Chain
Target	Administrative		
	Operational		
	Statistical		

# Efficiency benefits

The case of Healthcare (Blood Transfusion SC)

- Analysis of RFID technologies in supporting the whole blood supply chain (vein-to-vein process)

- Main goals:
  - Automating bags identification to enhance quality and safety of blood supply chain
  - Analysing how the processes can be re-designed thanks to RFID:
    - **supporting the centralization of the production and the biological validation of the blood collected )**
    - **enhance resources employment**

# Efficiency benefits

The case of Healthcare (Blood Transfusion SC)

- Risk-based method to assess the impact of RFID on:
  - Patient safety
  - Quality of blood products
  - Service continuity
  - Donor care

FMECA (HFMEA) approach:

$$RPN_i = OSR \times SSR_i \times DSR$$

*RPN* = Risk Priority Number

*OSR* = Occurrence Score Rank (probabilità di accadimento)

*SSR* = Severity Score Rank (Severità del danno associato)

*DSR* = Detectability Scale Rank (Rilevabilità dell'errore)

# Efficiency benefits

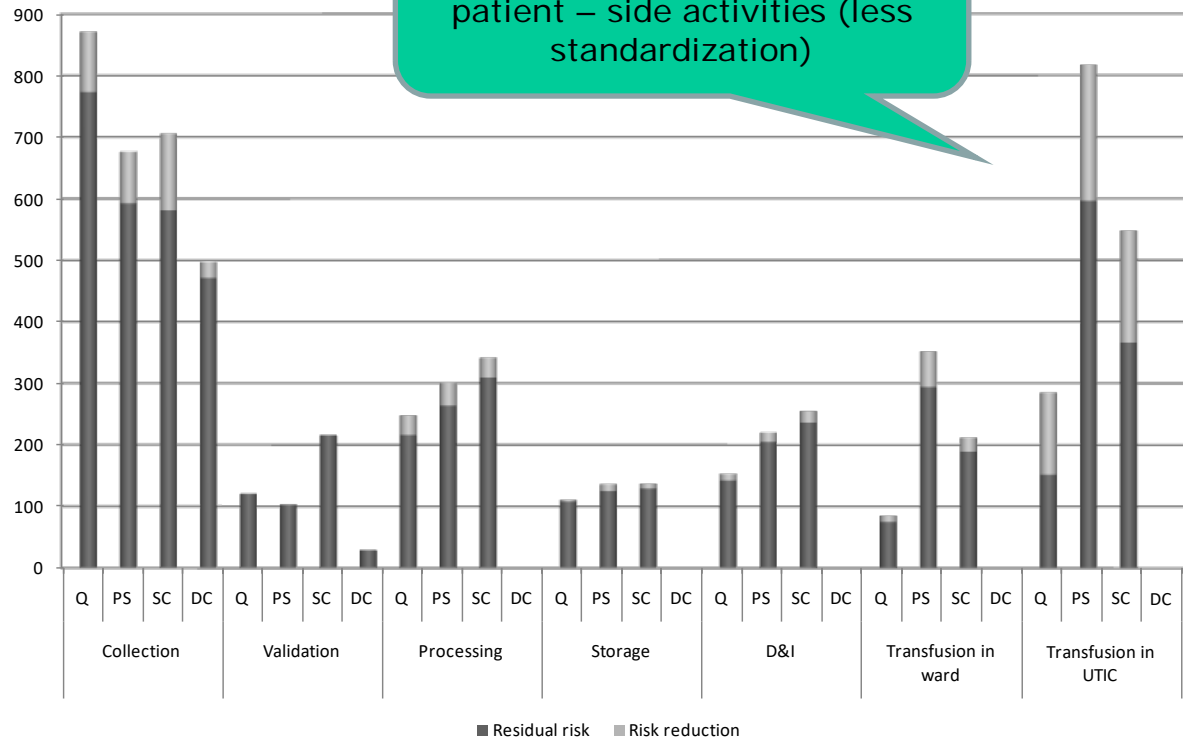

The case of Healthcare (Blood Transfusion SC)

- Risk-based method to assess the impact of RFID on:
  - Patient safety
  - Quality of blood products
  - Service continuity
  - Donor care

The extent of performance improvements is mainly dependent on the ability to design better (e.g. safer) processes and activities

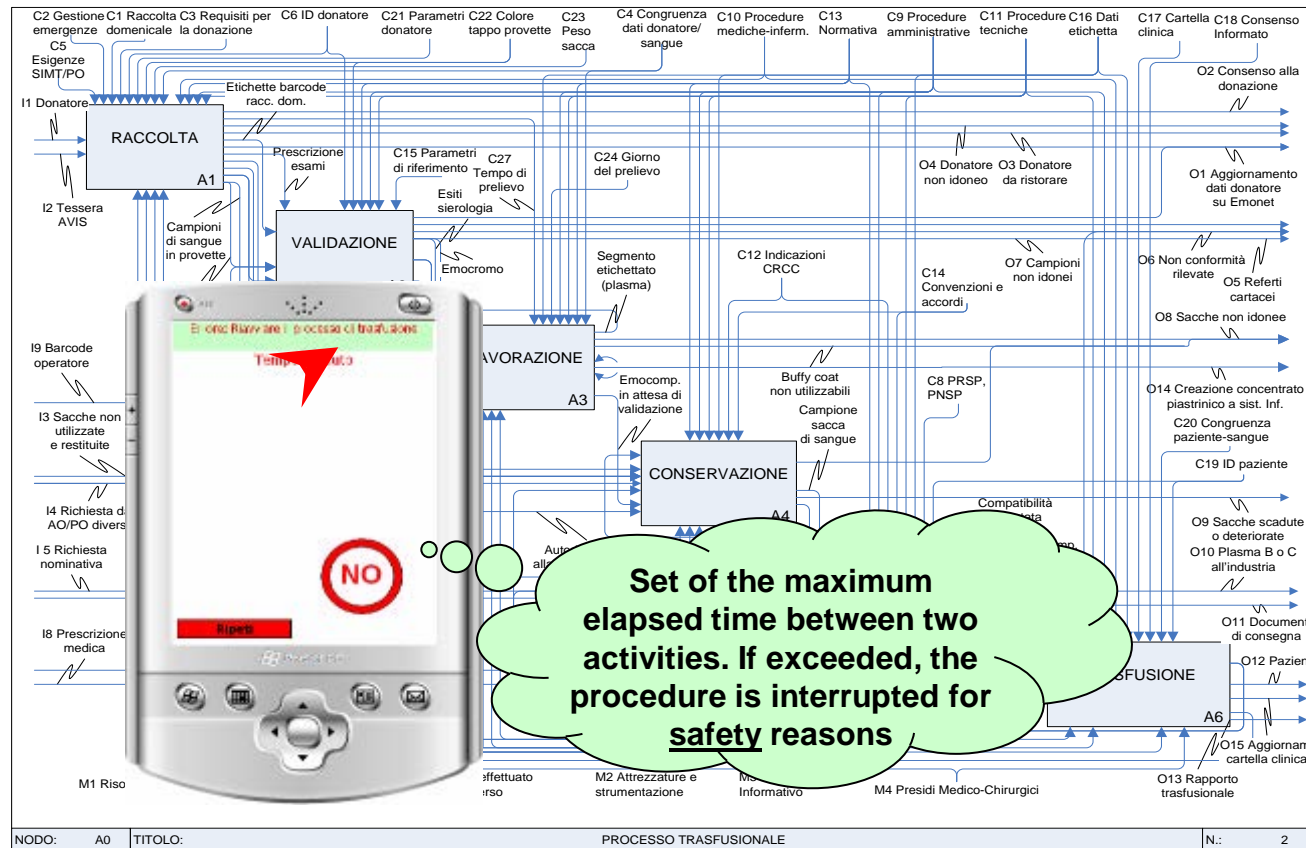

Positive performance improvement, especially on patient – side activities (less standardization)

# Efficiency benefits

## The case of Healthcare (Blood Transfusion SC)

# Efficiency benefits

Generalizing the method

- A two step evaluation...

- Available options:
  - Direct analytical evaluation
  - Direct measurement
  - Computer simulation
  - Queuing theory
  - FMEA
  - ...
- Available options:
  - Direct analytical evaluation
  - B-plan estimates
  - Educated Guess
  - Benchmarking

# How to assess the benefits in this case...

Tracking returnables: the Cablecom(\*) case

**Objective:** real-time monitoring of location and state of the cable returnable drum

## Sensing:

- GPS (**location**)
- MEMS accelerometer (**shocks, rotation**)
- **Smart energy management** (sleep mode, LPWA ready)

## Functionalities:

- 2-year operating life, with real time monitoring (location, hits)
- Local algorithm to estimate the remaining wire (as a function of wire thickness and number of revolutions)

(\*) Fictional name due to confidentiality reasons

# Innovazione e outsourcing

Gary P. Pisano, 2009, “**Is the U.S. killing its innovation machine?**”

“The prevailing view of the past 25 years has been that the U.S. can thrive as a **center of innovation** and **leave the manufacturing** of the products it invents and designs to others. **Nothing could be further from the truth.**”

This logic is predicated on utterly false assumptions about the divisibility of R&D and manufacturing... **R&D and manufacturing are tightly intertwined. Unless you know how to manufacture a product, you often cannot design it.** And, to understand how to manufacture it, you have to have manufacturing competencies and experience.

**To innovate, you need great two-way feedback.** You need to transfer knowledge from R&D into production, but you also need to move knowledge from production back to R&D. ... What this means is that **when manufacturing capabilities migrate from a country, design and R&D capabilities eventually follow.**”
